Introduction

Please read this manual carefully. It contains information vital to the correct maintenance of your machine.

It is the Dealer's obligation to arrange for your machine to be commissioned at the time of delivery by a competent person who will also instruct the operator in its operation under actual working conditions and advise on its care, maintenance and lubrication.

IMPORTANT

When ordering spare parts it is essential that the Model and serial numbers of the machine are quoted as well as the correct part number and part description from this manual.

WARRANTY

Buckton guarantees this implement to give trouble free service under normal use and maintenance and is guaranteed to be free of defects in workmanship and materials for a period of 12 months from the date of purchase.

Should any faults appear, repairs will be carried out free of charge at the discretion of the Manufacturer, by an Authorised Dealer or at the Manufacturer's factory. Warranty only covers the cost of the workman's time actually spent on the repair or fitting of the faulty parts. All cost of Freight, Transport and Travelling costs shall be borne by the user.

No liability will be accepted for consequential losses, delays or damage, or for faults caused by accident, misuse or normal wear and tear.

Faulty parts shall be retained by the Dealer and returned to the Manufacturer if required.

No person, agent or Dealer is authorised to give any warranty on behalf of the Manufacturer, nor to assume for the Manufacturer any other liability in respect of any product unless made in writing from the Manufacturer.

All warranty claims must have prior approval from the Manufacturer, to be made through the Dealer, using warranty claim forms provided by the Manufacturer.

Buckton reserves the right to change specifications and equipment without notice and without obligation to machines already supplied.

OPERATING YOUR FORAGE WAGON

Initial setup & operation

Connect up the hydraulic hoses to the tractor, preferably with a double-acting hydraulic auxiliary valve, or in the case of a single-acting auxiliary, one pressure and one return/dump hose. Before loading and feeding out the first load of silage, engage the hydraulics and rotate the hydraulic control handle anti-clockwise until the floor stops moving forward.

Load the wagon starting at the rear and working towards the elevator.

With the wagon loaded as required and the controls set so that the floor does not move, engage the hydraulics to start feeding. When the silage at the elevator is completely clear with the floor stopped, slowly rotate the hydraulic control handle clockwise until the desired feed rate is achieved. The sensor is now set to your requirements and will not need any further adjustment, unless the feed type is changed. Setting the floor rate too heavy may well cause failure of the elevator system.

For fast rear unloading when harvesting, reverse the hydraulic flow by operating the double-acting auxiliary valve in the other direction or by swapping over the two hoses in the case of single-acting. No adjustments are necessary and the elevator automatically stops. Make sure that the rear door is unlatched. Operate the hydraulics and keep moving forward to prevent build up behind the wagon as you unload.

General safe use

Operating a Buckton Forage Wagon involves several safe work practices, which are also listed in the Machinery Risk Assessment page including:

- !!! Disengage drive and turn off tractor before removing guards or before servicing.
- !!! Read all warning labels on machine.
- !!! Never use your hand to check for oil leaks – to locate small leaks, use a small piece of cardboard, paper or wood.
- !!! Do not ride on machine.
- !!! Stand well clear when operating.
- !!! Do not use machine in steep areas where there is a risk to the operator of a roll-over occurring.

MAINTENANCE

ENSURE CHAINS ARE TENSIONED ON A REGULAR BASIS

Adjustments

Elevator Chains:

- Slacken lock nut and adjust tension to give 40-50mm (1½" to 2") slack in the centre of the elevator chain.
- Re-tighten lock nut.

Floor Chain:

- Slacken lock nuts and adjust tension so that the floor chains in the centre of the top of the floor have 100mm (4") clearance.
- Re-tighten lock nuts.

Cross conveyor belt:

- Belt adjustment, if necessary, should be done at both ends to set 'tracking' correctly.
- To adjust tracking tighten the appropriate adjuster, the belt will run to the side that requires tightening.
- If belt is tracking correctly, and only requires tensioning then adjustment only needs to be made at the discharge end.
- To adjust belt tension at discharge end, tighten adjustment bolts equally, ensuring that the belt continues to run/track in the centre of the conveyor tray. To adjust tracking at drive end, adjust bolt at rear of conveyor so that belt tracks in the centre of conveyor tray.

Wagon Manual

Lubrication

It is essential that the bottom elevator roller sprockets and rear floor shaft sprockets are greased daily for the first week (7 days) of operation. If used initially during harvesting, requiring reversing of the floor, the rear shaft sprockets will require greasing at 3-hourly intervals. Failure to do so in the above instances will result in machine failure.

Thereafter – grease weekly during use, grease nipples located as shown below:

Grease Nipple Location	Number of grease nipples	
	SD 83,100,130,160	SD200
Rear floor shaft sprockets	2	4
Front floor shaft	3	5
Elevator top shaft, (non-drive side)	1	1
Bottom elevator idler sprocket	2	2
Parking jack	2	2
Tandem axle pivot pin (both sides)	4	4

Elevator and floor gearbox oil levels should be checked prior to being used at the beginning of the season. Remove oil level plug, remove filler plug and add EP90 gearbox oil until excess flows out level plug hole. Replace both plugs. If oil leak is noticed at either gearbox, repairs should be carried out immediately to prevent premature gearbox failure.

At the end of the season clean wagon thoroughly and re-grease at all points. Check and/or top up gearbox oil levels and shed store.

POINTS TO WATCH FOR –

- **Tractor and wagon QRCs in good order and oil flow not restricted.**
- **Cross conveyor belt remains free and does not become stuck to unit body because of water and lack of use.**
- **All shafts straight and undamaged.**
- **All chains tensioned periodically if slack.**
- **Wheel bearings and wheel nuts checked seasonally.**

REGULAR LUBRICATION!!!!!!!!!!!!

Health & safety machinery risk assessment

Buckton Forage Wagon

A hazard identification, risk assessment and risk control procedure has been carried out on a representative example of a BUCKTON FORAGE WAGON and where found necessary the appropriate risk control measures have been incorporated in the product specifications. The Operator's Manual contains the necessary information and safety warnings are applied to the machine where necessary.

What is a hazard? A hazard is any situation that may cause injury or illness.

Risk Assessment Rating: Measures the probable frequency of an accident against the potential severity.					
		Severity Potential			
		Fatality	Major Injury	Minor Injury	Negligible Injury
		4	3	2	1
Very likely	4	16	12	8	4
Likely	3	12	9	6	3
Unlikely	2	8	6	4	2
Highly unlikely	1	4	3	2	1
Probable Frequency					

Hazard:	Potential Risk Source	Fr	Sev	Rating	Safety Measure:
Damage to limbs, crushing, abrasions	Moving chains and rotating sprockets	1	3	3	Warning labels/instruction book. Sprockets and chains can only move with drive engaged. Disengage drive prior to servicing or inspecting.
Entanglement, drawing in, trapping	Moving chains, rotating sprockets and bars	1	3	3	Warning labels/ Instruction Book
Damage to fingers/eyes through high pressure fluid ejection	Hydraulic oil pressure leaks	2	2	4	Warning in Instruction Book Adequate pressure ratings for all components.
Instability under varying conditions	Machine Roll-Over	2	4	8	Warning in Instruction Book/Adequate weight on hitch. Do not operate in steep or slippery areas.
Slipping, tripping or falling	Riding on or standing in front of machine	1	3	3	Warning in Instruction Book.
Damage to fingers/eyes through ejection of material	Cross feed conveyor mechanism	1	2	2	Warning in Instruction Book. Warning label.
Crushing or trapping	Movement between tractor and wagon	1	3	3	Parking jack. Do not ride or stand on drawbar. Keep clear when operating.
All the above hazards	Lack of information				Operator's manual outlining safety and correct operating procedures.

General Warnings

**STAND WELL CLEAR
WHILE MACHINE IS
OPERATING**

**DO NOT ENTER
WHILE MACHINE
IS OPERATING**

**MACHINE DRIVE
MECHANISM MUST
BE DISCONNECTED
BEFORE SERVICING**

**ENSURE JACK
IS SECURELY LOCKED
BEFORE UNHOOKING
FROM TRACTOR**
